As the primary component of the subject of "noncommutative topology," K -theory has opened vast new vistas within the structure theory of C^* -algebras, as well as leading to profound and unexpected applications of operator algebras to problems in geometry and topology. Example. The eigenvalues of the operator on (the real vector space) R^3 whose matrix representation is $\begin{pmatrix} 2 & 4 & 0 \\ 0 & 2 & 0 \\ 0 & 2 & 0 \end{pmatrix}$ are 2 and $+2$, the latter having (both algebraic and geometric ...
